Photoshop is certainly better suited for those who do a lot of graphic editing than people who prefer to work in the dark. Substance provides access to Photoshop's tools and features via the bridge for the first time, bringing access to the powerful Photoshop Content Aware Move and Liquify features to Substance Radiance, making it the easiest way to get started. Photoshop understands everything in a Substance Radiance project, making it intuitive to use even without Photoshop training. Substance Designer can view, edit, and save files in the Photoshop file format, importing layers, curves, and masks. Substance Designer and Radiance both address priorities for native Mac GPU-accelerated applications, especially for still photography and 3D rendering. Substance introduces photorealistic materials and lighting, which make images more realistic - before the introduction of any physical support. The material editor provides a high-fidelity painterly approach to in-camera retouching and post-production, which is an entirely new tool in the 2Armed workflow. The Substance Editor and Substance library offer the same tools as Photoshop, including the fastest Mask and Camera Raw Workflows in a photo-editing application. Many of the same tools, such as Layer Comps, Shadows and Highlights, Curves, Lens Correction, and Spot Healing Brush, are supported for free. The Radiance team has also taken glass node fanciness to a new level with advanced texturing and dynamic material options that are supported by Substance materials. The Substance Native workflow uses all the current industry-standard Photoshop workflow tools, with the new Subsurface Scattering support for scattering and refraction in Spirit and Shadow catcher.

Adobe Photoshop Elements seems to be retaining the same look and feel, minus a few cosmetic tweaks, even in this first macOS 10.20 update. In addition, some bug fixes and performance enhancements have been made to the program. As with any update, you can expect support for new features and performance enhancements coming in subsequent versions. Adobe Photoshop 2019 introduces new features that will make it easier to work with type, scale and distortion in a robust and reliable way. From working with images in different color spaces to performing advanced corrections for red eye and clarity of skin, to letting users adjust lighting using the Kelvin look-up table, enhancing shadows, and rolling back the distortion effect of the new Lens Correction feature, there's a lot in this version. After 5.0, the update includes the Camera Raw Profiles functionality in the Develop module, which enables users to view and optimize the color and mask settings of individual channels via Camera Raw. The update also introduces additional filters and adjustments through the Lens Define feature, while the Update Layer List function lets users quickly view all changes in a layer. In the next version of the software, users will also be able to display more raw data from the sensor in the Histogram window. Combined, these updates simplify the working environment, making it easier to adjust the color tone, intensity, hue, and saturation of images across multiple channels.
