S.M.Seth.Q: Make new row when calling Python PySpark code I have an application that pulls data from a database, parses the data into a dataframe and then cleans the data, throws out all the bogus data and then saves it to a database. There are a couple of functions that call the data processing function. This function does some stuff and then once it is done, it calls another function to do some additional processing. The problem is that I have two separate functions calling this same processing function and both of those functions trigger the data processing function to be called. They are running at the same time. When this happens, two new rows are created in the database which is not what I want. I could put the data processing function into a separate function so that it is not called until the other functions are done, but this makes the function longer. There are no errors in the code or any errors in the database as far as I can tell, so I don't know what is causing this to happen. Does anyone have any suggestions on how to fix this? Here is the code for the functions: def data_processing_function(data): f988f36e3a
