Futurama, as other art programs, uses layers to create images. In Photoshop, they can be very useful, but can be a bit tricky to use. I am not hot on the idea of separating your background layer from the star-studded layers that you add on top of it. It just feels like a lot of trouble. But then again, a lot of things feel like a lot of trouble in Photoshop. When initial release of Lightroom for iOS and Android arrived, I was slightly underwhelmed. From what I could tell, it was like a glorified version of what you get as part of Lightroom for desktop. But I was pleasantly surprised to find out that they've since added a ton of new features to the iOS version. And that's when things started to get good. The new Lightroom Mobile app comes complete with a dark and luminous themes, an intelligent search feature, easy automatic adjustments, face tagging (in order to quickly add a specific name to a certain image), and more. I also like the automatic adjustments—another smart tool that's missing from Lightroom for desktop. And of course, it wouldn't be complete without the beloved customizable workspace with the familiar and useful tools that you've come to appreciate from the desktop Lightroom versions.
