It includes two main blocks: ... Efficient Network Design is an application to analyze, design and verify efficient topologies for complex communication networks, such as the Internet. The application is based on a generic algorithm that generates the topology with best objective performance, minimizing cost and traffic. The application does not limit itself to any particular protocol, but it uses an ad-hoc toolset (just libraries) that... The SolveIt! application by Imagine Technologies Inc. is a powerful interactive geometry tool for use in a variety of engineering disciplines, including architecture, civil, mechanical, and construction. It features a comprehensive library of geometric primitives that cover a wide range of applications, and a complete set of analysis and optimization tools to help you solve any... The Griddler! application by Imagine Technologies Inc. is a powerful interactive geometry tool that allows you to create your own model, interactively design it and analyze its functionality in real time. It is ideally suited for any application in architecture, civil, mechanical and construction engineering. Griddler includes a library of thousands of geometry primitives and... The Synergistics application by Imagine Technologies Inc. is a powerful interactive geometry tool that allows you to create your own model, interactively design it and analyze its functionality in real time. It is ideally suited for any application in architecture, civil, mechanical and construction engineering. Synergistics includes a library of thousands of geometry primitives... The n-Body Simulator (nbsim) is a simulation program for calculating the trajectories and forces between bodies of different masses that interact with each other. It uses the numerical integration package, SIMULI, developed by the Max-Planck-Institut für extraterrestrische Physik. It is primarily intended to be used as a test bed for the development of new integration methods, but... CYCLES is a unified information about the designed two-phase flow processes. The applicability of the developed software package CYCLES is based on its simple and user-friendly interface that allows the users to monitor, control, calculate and visualize the process performance in a user-friendly manner. PROGRAM STATUS tab creates a window displaying a visualization of the current process conditions. MULTI-CYCLES allows the users to monitor and analyze the performance of multi-phase flow processes in a simple manner. The user can view process flow information as well as process performance information (e.g. process maps, pressure, temperatures and turbulences) using a unified interface. This tool provides a simple interface to assist users to model P&ID systems based on the generalized PID algorithms. It is an effort to provide a systematic and a rigorous approach towards the modeling of process based upon the modeling of PID systems. The main difference between this tool and other similar tools is that here the analysis of the temperature field as well as the thermal feedbacks are included as an inherent part of the model. The assumption of the nature of the temperature field, for instance, whether it is transient, steady, periodic or spatio-temporal field. Also, the PID model and nature of the thermal feedbacks, for example, the thermal mass, is addressed in this tool. The user can run the analysis of the PID model as well as the PID model analysis in the same interface. SINNA is a tool that facilitates the creation of multi-objective optimization models. By using a matrix approach, the modeler is able to easily define a plurality of goals and their corresponding weights. This software is developed for the measurement and recording of the flue gas and the disposal of the ash and slag. It is a software for computer-aided design and analysis of the flue gas and slag ducts, and ash and slag pit of the incinerator as well as its operation. The new version provides an easy-to-use graphical interface and comprehensive application programming interface for the simulation and optimization of the incineration process in industries. It is a simulation software for controlling and optimization of the combustion and subsequent control of the gas released into the atmosphere, including control of the emission of toxic gases from the incinerator. The main target of this software application is to provide a complex analysis tool for the operators of heat and power industries 2edc1e01e8
