Be that as it may, there is one feature not in Photoshop Elements 3 that should be in every application: a **quick feature list**. Are there any new tools in town? Is there a way to disable the Trash Can on the desktop? What's new in screen brightness?

Other new features include gesture controls for faster navigation and an improved "Quick Develop" mode that lets Photoshop preview your images, apply filters, and save them without needing to render them.

One of the main differences between Photoshop and Lightroom is that Photoshop can be used as a RAW editor, and even a proper photo editor. Lightroom is solely dedicated as a photography database, with support for both raw and non-RAW images. With regards to RAW support, Lightroom 4 introduced a few bare essentials for RAW conversions, but version 5 is bringing an entirely new set of tools to the table. DSLRs come with RAW files that allow for during-capture auto-bracketing, picture-stacking, red-eye reduction, skin-tone adjustments, lens corrections, and more.

It can even be configured to work in several different ways, such as moving focus between different regions of the image or turning on or off the Highlights Recovery slider so you can recover highlights accurately, in any level of Photoshop.

The new object selection feature is also crucial. If you're used to using a program called Photoshop Express Edition for iPhone, iPad, and Android, you can achieve the same using the latest update. But there are a few differences. For example, there are no slider controls—on the contrary, you have both sliders and tabs. Also, using the selection tools in Photoshop Express' editor, you have to dive into the picture itself: you can't simply select objects and click the cropping tool. The point is that the selection process, which is very intuitive via a touch-friendly interface, will be easier to use on mobile phones.
